RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 66 pages. Original publisher: Aberdeen Proving Ground, MD : U. S. Army Research Laboratory, 2000 OCLC Number: (OCoLC)227944500 Subject: Nanostructures. Excerpt: . . . Particle size and grain size can be characterized using x-ray, electron microscopy, and particle analyzers ( GALAI CISI 00 and Brookhaven Instrument BI-XDC ). The GALAI CISIOO analyzer measures particles from 0. 5 to 600 pm in size by measuring the rotating laser time of shadowing, with additional particle shape analysis using a rapid video microscope picture analyzer. The Brookhaven analyzer uses centrifugal analysis with an x-ray detector and is capable of measuring particles from 10 mn to 10 pm in size. The stored enthalpy will be measured using differential scanning calorimetry ( DSC ) by integrating the exothermal signals. The structure will be carefully characterized and optimized to produce maximum heat. Such optimization can be achieved through adjusting rotor speed and adding appropriate surfactant. A common problem encountered with milling fine particles is the potential for significant contamination from the milling media ( balls and vial ) or atmosphere. Such contamination can be significantly reduced using a low-energy mill 66 , which can be achieved in our attrition mill by reducing the rotor speed. It has recently been shown 73 that the minimum nanocrystalline grain size for a number of elements milled in a low-energy mill is comparable to that from a high-energy mill 71, 74, 751. Surfactants may also be used to minimize contamination. For example, boric acid and borax were quite effective in reducing iron contamination 76 . Our attrition mill is also capable of fabricating materials in a vacuum environment, thus minimizing atmospheric contamination. 2. 3 Dynamics of Magnetic Domain Wall Motion. Many of the specific applications of magnetic materials...
